THE CORONATION

On May 12th, Their Majesties, King George and Queen Elizabeth will be crowned at Westminster Abbey in London, and for twenty-four hours over one quarter of the world's surface, ceremonies and events in celebration of the unique occasion will take place.

London, and its population of fourteen and a half million souls (one per cent of all the people on the earth) are preparing for the great event as only Londoners are capable. But even the capacity of the people of that great city may be taxed to the uttermost to supply accommodation and fill the needs of the additional millions who will travel from all the ends of the earth as spectators.

Four hundred years before Christopher Columbus was born, Alfred the Great, who founded the British Navy, was crowned King. Since then the Monarchy has survived many blistering storms, not the least of which the present generation has been privileged and proud spectators. Fifty-three Monarchs have ascended the throne since Alfred's Coronation, covering a period of time extending well over a thousand years.

Throughout all that time the King has always been held subordinate to the Laws of the Country, and sometimes in the face of Monarchical ambition, Parliament has been called upon to exercise its authority. From the earliest of times extending back to the Saxon period, "The Supreme Council" prevailed as even William the Conqueror in 1066 and subsequent thrones discovered. King John, he of Magna Charta fame, ran foul of the will of the people and was subdued.

Today, one fourth of the population of the world owe allegiance to the Crown of Britain. Some fifty odd Parliaments register in the name of His Majesty, for and on behalf of nearly 500,000,000 human beings of every colour and creed.

What is the bond that ties all the Dominions, States, Soverainities, Dependencies, etc., together? Not a very difficult question, and consisting of nothing more or less than the Crown itself with its mythical and sentimental ties, all emblematic of an Empire which is in reality not an Empire at all, as General Jan Smuts of South Africa (a comparatively recent enemy in arms) has pointed out, but more like unto a dynamic order out of which a Republic can never be hammered.

David Lloyd George, Britain's war time Prime Minister, has said: "This Empire is not a hollow dream to thump in boast, but a gigantic State awaiting wise developments for the whole World's sake as well as our own." And it takes a genius of a high order to operate that State successfully, a genius for government which the British people have manifested for centuries until there has been created that which for want of a better term we call "The British Empire".

The solidity of that Empire has been questioned and doubted time and again. Even as late as 1914 the leaders of the great German people scoffed and doubted, and were proved wrong. Through the trying events of the post-war period, and while other crowns fell in other lands, the British Crown, if anything, gained in respect and security.

What other crown or what other Empire could have weathered the heart-rendering events of December, 1936, when a human being who has served his country well and faithfully, voluntarily abdicated the greatest of all thrones—without the letting of blood?

So it will be that on May 12th a great pageant will take place, at which will be present the rich, the poor, the high and the low, from far and near as witnesses. The year 1937 will henceforth be known as "Coronation Year" to young and old alike.

The children especially will have occasion to remember it and locally, but necessarily in a smaller way, arrangements are being made to celebrate the event, and implant in their minds some never-to-be-forgotten seeds of remembrance which they will cherish for the rest of their natural lives.

SPRING AND WHAT

From consulting thermometers indicating "how much coal should be shovelled on to keep Madame comfortable, or if the ice is going to be fit for play, eyes will now turn sky-ward searching for indications of heaven sent moisture.

Spring, unlike old man Depression, is certainly just around the corner. While the young man's fancy may "fligh'th turn to thoughts of love", the anxious farmer and his city brethren will be estimating the chances of a fair crop, and hoping that this may be the year of "the million dollar rains."

With prices at a recent level, and assuming always that they may remain so until the farmer manages to dispose of his crop himself, for his own benefit, it is to be hoped that a fair yield will result in this district this year.

There are far too many factors to consider in estimating what wheat or other grains may bring (not excepting the actions of Federal Government Agencies) to warrant any guess, but even if wheat went to a dollar it should provide the farmer with a fair return for his labours.

The market for hogs should be good due to a continuance of the British quota, the Ottawa Trade Agreements, originally negotiated by the Bennett Government and renewed by the Mackenzie King administration as announced in the Dunning Budget. So far Canada has only been able to supply fifty per cent of her quota in that market.

Cattle prices are on the up-grade. We recently heard of a cattle shipment sold in the Chicago market at better than thirteen dollars per hundred, but this was for an exceptionally good bunch of steers, shipped from Dalmenau.

Western Canada has been very hard hit since 1929 and this district particularly so, but with a good crop at fair prices the outlook would take on an entirely different aspect, and that notwithstanding who might occupy the Seats of the Mighty.

FARM NEWS LETTER

PROPER PLACEMENT OF FERTILIZER

During the past decade the question of positional availability of fertilizers to crops has been the subject of extensive research, and the results have indicated very clearly that the application of fertilizers in rows or bands, placed within easy reach of the plant roots, is better than broadcast casting, says H. Leslie Smith, a well known authority on fertilizers. There is more than one reason for this. It was discovered that phosphoric acid, the active constituent of superphosphate which forms the base and bulk of practically all fertilizer mixtures, tends to become fixed in the upper inch of the soil when fertilizer has been broadcast on the surface. This is true especially of superphosphate, when supplied in the powdery form, the small particles being much more readily attacked by their phosphoric acid held by strong combining soil bases such as iron and aluminum. Results of investigations conducted by Lohse and Dabbs at the O. A. C. Guelph, showed that within certain limits, the larger the granule of superphosphate the greater was the availability of its phosphoric acid to plants.

The Fertilizer Band

The application of fertilizers in bands, rows of furrows has the advantage of (1) avoiding too wide and intimate contact of the fertilizer with the soil and promoting a chemical interaction among the fertilizer constituents themselves, resulting in the formation of new compounds in form available for assimilation by the crop; (2) placing the fertilizer at a depth where adequate moisture for its solution is present and in the same way accessible to the feeding rootlets of the plants; and (3), by reason of the conservative concentration of the fertilizer in the region of the plant root system, economizing in the amount applied per acre. In many instances 400 pounds per acre applied in bands or strips alongside plant rows produced as great a yield as was obtained by the broadcast application of 800 pounds of the same fertilizer. One has to consider, of course, that the residual influence of the smaller quantity of fertilizer applied in rows will not be so manifest on the crop of the following years, and many are familiar with the uneven growth of a grain crop following corn which has been fertilized in rows. Despite these apparent objections, the economic advantages of row applications to the broadcast method are unquestionable.

Where plants want it

The application of fertilizers for grain by means of the combination drill is an example of the band method, and its adoption in the western wheat-growing provinces has made fertilizers popular and profitable there.

For potatoes the most favorable placement of the fertilizer is on both sides of the row, 2-3 inches distant laterally and to a depth slightly lower than that of the seed-pieces. For tomatoes the application should be in bands opposite each plant and about two inches deep while for beans and peas 2 1/2 inches to the side of the row and about two inches below the seed level is recommended. The latter placement has proved suitable for corn fields also.

In view of these recommendations, it is obvious that many of the planting machines now in use are obsolete, and therein lies a serious, though not insuperable, difficulty in the way of putting the new method into practice. Some of the newer potato planters are designed to place the fertilizer in the position approved, and one must have patience with the implement manufacturer who does his best to meet the needs of these changing times; and it must be remembered that these changes are costly.

WHERE THERE'S A COW THERE'S ALSO A WOMAN

"I shall bring to thee a thousand pure spirits, running toward the pastures that give food to the cattle. Thus, in the Zend-Avesta, spoke Zarostrian, high priest of the ancient Persians, who, votaries worshipped the cow. It is possible that the Zarostrians introduced the cult among the Hindus, for they migrated from Persia, perhaps because of religious persecution. Be that as it may, the cow remains an object of veneration to the modern Hindu. A sacred animal the cow holds a prominent place, and Keats, in his "Ode to a Grecian Urn," describes "that better looking at the skies, and all her sullen flank, and her earlands drest." Something akin to idolatry is manifest in the attitude of many a cattle breeder of today, whose cow-cow are bedecked with the coveted red and blue ribbons at the fair. The cow wears her ribbons modestly, unmoved by the ad-

The SNAPSHOT GUILD

Night Snapshooting With
Box Cameras

Thanks to more powerful artificial home lighting, owners of inexpensive
slow lens cameras can now make snapshots indoors at night.

ARE you missing the fun of in-
door snapshooting at night?

Maybe because you have an in-
expensive camera, such as the box,
fixed-focus type, you think that in-
door picture-taking at night is not
for you. Perhaps you still suppose
that without an f.8 lens or faster,
you have little chance for success-
ful, except by making time ex-
posure. Be happy that such is the
case no longer. There is now avail-
able, for indoor instantaneous ex-
posure in your home at night,
a new and more powerful photo-
graphic flood light bulb (No. 2), and
with two or three of these in your
floor lamps, backed by inexpensive
cardboard reflectors and with a roll
of the fast super-sensitive pancho-
matic film behind your lens, snap-
shots at night can be made even
with the slower single lens cameras.
The initial investment in these new
bulbs is higher but, on the other
hand, they last three times as long.
So, now that practically every-
body can be in on the fun, consider
the precious subjects that these
more powerful lights permit a simple
box camera to photograph—the
children at their evening games or
in their nightgowns at bed, the
family gathered around the fire-
place, any evening parties when
friends come in, the pets, Dad read-
ing the paper, and what not.

One of the enjoyments of making
pictures at night is that you can
control the illumination. In doing

this, however, care should be taken
to obtain the right balance of light.
Remember that usually you get a
better picture with more illumina-
tion on one side of the subject than
on the other. Either two flood light
bulbs should be used on one side
and one on the other, or, if only two
are used, one should be placed closer
to the subject than the other.

The light nearest the subject is
the main light—the one which pro-
duces the high lights and shadows
necessary for proper modeling of
features. The other is used to bal-
ance the lighting—to illuminate
features so that they will not be too
dark. If this light is placed too close,
faces will appear flat and lacking in
roundness. On the other hand, if it
is too far away shadows on the side
away from the main light will be too
dark and the lighting will be harsh.

Suppose that you have placed a
bulb in each of two bridge-type
lamps with the shades replaced by
the cardboard reflectors. You will
probably get a good balance of light-
ing by having one lamp about three
feet from the subject and the other
about four. It is an excellent plan
before you snap the picture to ex-
periment with the lamps in different
positions, watching the different
lighting effects on the face or faces.
Always use the largest diaphragm
or stop opening. Slow lens cameras
having adjustable shutter speeds
should be set to take the picture at
1/25 second.

JOHN VAN GUILDER

So They Tell Me

By the Cub Reporter

A group of young boys seen knock-
ing down a game of marbles. Some
of them weren't so young.

Roy Gayford disturbing the early
morning quiet with his shrill. If not
altogether musical, whistling.

Young Harry Holmes reported dis-
turbance a few vocal interruptions while
on the road home from Gem last Fri-
day.

Several of the local ball tossers
limbering up the old soup-house on
main street the other day. "Chaff",
an ardent canine follower of the ball
game, what game, showing the
best signs of pre-season training, and
is already injecting much action into
the game.

What happened to your fine Fraser,
we haven't seen you flying it?

Dorothy Lewis endeavoring to teach
a newly acquired puppy to keep the
leash taut, in front—not behind.

Roy Smith instructing "Sherry"
Foster as to the proper care of his
new Ford V-8.

We really don't know how it all
happened, but the story we heard was,
"Casey" accepted a ride on a saddle
horse, offered him by Gordon Walker.
Mounted upon the gallant steed, he
proceeded to exhibit his prowess as
a horseman. Taking the reins in
his hands "Casey" proceeded to head
the animal down the street. Every-
thing seemed to be progressing fa-
vorably until a tree loomed up, im-
mediately ahead. Then "Casey", possibly
flaunting he was driving the Terra-
plane, dropped the reins, grabbed the
horn, gave it a sudden twist, at the
same time the tree reached out and
hit him, knocking him from his mount
plunging him in a heap on the ground.
The fall resulted in a slightly frac-
tured wrist. When help arrived, it is
reported "Casey" was sitting up in
a slightly dazed condition humming a
tune, his right foot going up and
down, and his hands making motions
as though he was playing a snare
drum. With his left arm swathed in
bandages and tape, it is not likely
"Casey" will be continuing his role
as a drummer, at least not for a few
days.

Pete Ubertino wearing a fan down
main street. Aren't you a bit early
with your cooling apparatus, Pete?

S. Ross couldn't resist the warm
sun of Monday afternoon, thinking it
a very opportune time to wash the
windows of his garage.

Constable Gillespie seen chasing
down a foe—on the football field
last Wednesday.

FOOD FROM AIR

The atmosphere contains nearly 80
per cent of nitrogen and only 3-hun-
dredths of one per cent of carbon
dioxide. From the latter minute
supply, absorbed through the stomata
of the leaf, plants derive the carbon
which constitutes more than half their
dry matter; whereas access to this
vast store of nitrogen is denied to all
plants except the legumes—alfalfa,
clover, beans, etc. Let us be truly
thankful for the legumes.

Eternity is something that begins
after you are dead. It is going on
all the time. We are in it now.—
Charlette P. Gillman.

When you know a thing, to hold
that you know it; and when you do
not know a thing, to allow that you
do not know it—this is knowledge—
Confucius.

CROWFOOT NOTES

(continued on page three)
and executed through newspaper
publicity.

Newspapers do not just happen.
Even the smallest newspaper is pub-
lished at great expense. They re-
quire plants, employees and materials
before they go in your hands to be
read. In order for newspapers to
exist they must have revenue and the
only profitable revenue they have
comes from the advertiser. In turn
the advertiser is repaid by publicity
that builds his business.

We assure every merchant, no
matter where he may be located, that
the quickest way to build his com-
munity is to back his newspaper with
a generous amount of advertising.

"So many times a merchant will
say, 'Well, it does not pay. It is
money thrown away. That is untrue
and wrong. It is not an unprofitable
investment. A newspaper in even the
smallest town has a rural country-
wide coverage. It is eagerly read
because through no other channel can
the news of a community be told im-
mediately."

"Start now and patronize your home
town newspaper as it is the greatest
factor in the future progress of your
community."

SERVICES MADE POSSIBLE

Because a Province-Wide
System Serves You

EVEN the smallest village connected
with this province-wide power system
has electrical energy available every moment
of the day and night.

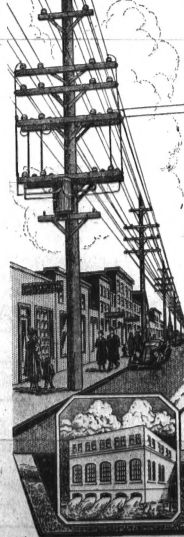

Surplus water power capacity intercon-
nected with steam plants and a network of
power lines, all of which are operated and
maintained at a high standard of efficiency,
make electrical energy available instantly
and economically.

The operation of the Company's system
requires a skilled technical staff, and in addi-
tion, local managers who are located at many
points throughout the Province. Facilities
are thereby available through which the
Company provides consumers of electricity
with the best solutions of their electrical
problems, and acquaints them with the latest
developments in equipment and appliances.
This service enables our customers to obtain
from the electricity used the best results at
the least cost.

Local and Personal Notes

Mr. August Villadon of Canby visited at the hospital on Friday.

Mr. Clark and son Jamie, of Cluny were visitors in Bassano on Tuesday.

Miss Bernice Rickman of Canby visited Mrs. Conne Macbeth over the week-end.

Harry Hansen of Brooks was a Bassano visitor for a couple of days this week.

Bob Bacon met with a near serious accident last week, when his eye was badly cut while playing.

Maurice and Sam Edwards, Harry Pezual, Charley Connally, and B. Rathbone were Calgary visitors on Wednesday.

Mrs. W. E. Sambrook returned to her home in Drumheller Saturday after visiting at the home of her sister, Mrs. W. Redmond for a few days.

Mrs. Sheppard and children of Calgary are expected guests at the Magnus home this week-end on their way to Regina.

Mr. and Miss Newman will be the guests of Mr. and Mrs. Sharp for a few days before entraining for their trip to England.

There will be baseball practice at the Sports Grounds on Sunday afternoon at 2 p.m. All those interested in baseball are asked to be present.

If interested in experimenting in the growing of Soy Beans, get in touch with the Bassano Branch of Trade. Secretary, M. Haynes, or J. Johnston, president.

Tickets on the Fox Fur to be drawn for at the Altar Society Whist Drive and Dance tomorrow night have been selling fast. The secretary would appreciate it if sellers would stop the stubs in as early as possible so as not to cause any delay. The fur has been on display in Jas. Johnston's store for the past week.

SNEAK THIEVES OF THE GRANARY

Gas-mak is a term which, unfortunately, all are familiar in this enlightened age, and it might be expected that, in the interests of humanity, those who engage in grain threshing operations on farms where the practice of treating seed against smut is neglected should be provided with gas masks, says H. Leslie Smith, in the current issue of his Farm News Letter. This is no joke, as any who have known the headaches and hangovers, caused by the pungent, penetrating smut-laden dust, can testify. But smut dust, while disagreeable enough in itself, is evidence of still more serious trouble—the theft of real money from the farmers' pockets.

Presenting the Smuts.

Smut belongs to the disreputable family of Cellulose. There are several members, each one a dirty thief. Bunt or stinking smut is the commonest, common name of one which preys on wheat; another is the covered-smut-of-barley; others are responsible for the smuts of oats, while utillago maydis sneaks up on corn. The menacing marauders must be opposed in the incipient stages of their attack. Lurking on the seed itself, the organism injects its thread-like mycelia into the tissues of the seedling shoots and, as a parasite grows up with the stock, and completes its life cycle by producing spores in the ear, producing kernels of smut instead of grain.
